

**METHOD TO PROVIDE CACHE MANAGEMENT COMMANDS IN A SYSTEM  
SUPPORTING CACHEABLE DMAS**

ABSTRACT

The present invention provides a method and a system  
5 for providing cache management commands in a system  
supporting a DMA mechanism and caches. A DMA mechanism is  
set up by a processor. Software running on the processor  
generates cache management commands. The DMA mechanism  
carries out the commands, thereby enabling the software  
10 program management of the caches. The commands include  
commands for writing data to the cache, loading data from  
the cache, and for marking data in the cache as no longer  
needed. The cache can be a system cache or a DMA cache.
